

PRODUCT INFO

Joint clamps GMQ of die-cast aluminum have split clamping points with identical round or square cross-section that have been partially machined by cutting methods. They are comprised of two swivel clamps LMQ.

The clamping point bores are situated in a plane and are connected by the clamping joint to swivel by $\pm 90^\circ$, from parallel to perpendicular. They receive typically available construction tubes via multiple ribs in the cross-section of the bores.

At the screw points, hex socket cap screws or adjustable hand levers reduce the bore cross-section for clamping.

A hex socket cap screw or an adjustable hand lever at the clamping joint serves for locking the joint axis.

Adjustable hand levers are intended for repeated, tool-free clamping. Under the designation HSK, these are available separately for individual use and in other designs. Compared with the tool-operated hex socket cap screw, the clamping force achievable with an adjustable hand lever is lower due to the shorter lever length.

ACCESSORIES

- Adjustable hand levers **HSK** see page 168

ON REQUEST

- Clamping points with different diameters d₁ and d₂ or special diameter
- Screw points with hex head screws or mixed screw / adjustable hand lever elements
- Surface ball-burnished, anodized or powder-coated in other RAL colors
