[ INTRODUCTION ]

A linear motor system is a part of a specific machine. Tecnotion’s Ironless linear motors are components that can be combined with numerous application devices. This manual is intended for technicians who want to construct a machine that includes a linear motor system.

It gives insight in the basic components of a Tecnotion ironless linear motor and additional components to complete the whole motion system. The manual further informs about important design and installation aspects of the linear motors. The settings required before starting up are discussed.

In the appendix the important dimensions for designing the construction that will hold the linear motor can be found. Finally, the glossary gives insight in the definition of all specifications of a Tecnotion linear motor.

When installing a linear motor system one should be familiar with some important safety remarks. In the first chapter these remarks are made. Please, read them carefully.

1. [BEFORE YOU START]

Please read the following instructions very carefully. They are important for a safe and warranted installation and operation of the Linear Motor.

1.1. Important notice

Before installing and using the Linear Motor, read this instruction manual carefully. The manufacturer declines all responsibility in case of accident or damage due to negligence or lack of observance of the instructions described in this manual. The manufacturer also declines all responsibility in case of accident or damage in conditions that differ from those indicated in the manual; Tecnotion also declines all responsibility for damage caused by improper use of the Linear Motor.

Handle the components of the Linear Motor with care, packed as well as unpacked. Especially the magnet yokes are sensitive to mechanical shocks. Never drop a magnet yoke or release it in an uncontrolled way.

Do not expose the magnets to temperatures higher than 70°C. The magnets may be demagnetized at higher temperatures.

Unpack the Linear Motor and check its integrity. If there is any irregularity. If there is any irregularity contact the dealer or manufacturer, signalling the nature of the defects.

Make a note of the serial number. This facilitates the correspondence with the supplier.

Safety and information symbols:

The lightbulb describes a ‘Tip’.

The exclamation mark is a, non safety related, important notice that the user should be aware of.

The warning signs inform about safety information that the user should respect.

1.2 Safety warnings

The Linear Motor is used as a part of a machine. The machine manufacturer or representative has to take care that the machine as a whole fulfils all CE requirements.

The magnet yokes show large attraction forces on all soft magnetic objects such as iron. These forces cannot be controlled by hand. They may cause serious jamming danger. Do not bring any soft magnetic objects (iron) nearer than 25 cm of the magnetic side of the magnet yoke.

Magnetic sensitive objects like banking cards, pacemakers or other magnetic information carriers may be damaged if they are brought within 1 m of the magnet yokes.
BEFORE YOU START

The magnet yoke and coil unit can be damaged when cleaned with a non-prescribed cleaning agent. Use only isopropanol as a cleaning agent.

UV Blacklight can cause irreversible damage to the eyes and other tissue when exposed. When using a UV Blacklight installation wear appropriate protective clothing and glasses.

The magnet yokes do attract each other while mounting. Take care that the closing plates of one yoke do not damage the magnets of the neighbour magnet yoke while mounting.

If at any time and in any situation there is any doubt about the safety of the Linear Motor, do not use it and contact your supplier.

The Linear Motor is powered by a servo amplifier. In case of a power disruption or fatal error this may automatically result in a free run out of the motor. Make mechanical precautions to prevent damage on the motor or your machine in the case of such an event.

Before installing the motor, make sure that the supply mains are grounded and operate in conformity with the regulations in force.

Make sure that there is an effective protective earth. Make sure that there is no voltage at the wire terminals before connecting.

An earth connection does not work on non-conducting mounting surfaces like granite. In these cases the protective earth must be established by an earthing wire.

Before carrying out checks or doing any maintenance, clear the system by disconnecting the voltage. Be sure that there is no possibility of accidental connections.
1.3 Certification

All information about certifications can be found in this chapter. The declaration of conformity can be found in APPENDIX E.

1.3.1 CE certification

Tecnotion B.V. declares that the UM, UL, UX, UXA and UXX linear motors mentioned in this Installation manual are manufactured in accordance with European directive 2006/95/EC and in conformity with the following standards, see table 1.1.

Tecnotion B.V. declares that the UC and UF linear motors mentioned in this Installation manual are destined to be incorporated in other machines or to be combined with other machines, and is not (entirely) in compliance with the Machine Directive (98/37/EC). The UC and UF linear motors are in conformity with the following standards, see table 1.1.

<table>

</tr>
</tbody>
</table>

Table 1.1: Applicable standards

1.3.2 UL / CSA certification

Tecnotion B.V. Ironless motors currently do not have UL / CSA certification. Please contact your local Tecnotion representative for more information.

1.3.3 Restriction of Hazardous Substance (RoHS)

Tecnotion B.V. declares to be compliant with the RoHS-guideline. Therefore Tecnotion ensures that all products are free from lead, cadmium, mercury, hexavalent chromium, polybrominated biphenyls or probrominated diphenyl ethers.

Table 1.2: Overview of applicable standards per motortype
2. [ MOTOR COMPONENTS ]

An ironless linear motor of Tecnotion is not a system on itself. It contains several components, such as a coil unit and magnet yokes. The components should be build within a total machine concept or a working unit. The size and the shape of the mounting frame, the design of the slide, the type bearings or the kind of dampers depend of the required application. For instance the mounting frame and the slide should be designed in such a way that a correct air gap between coil unit and magnet yokes will be obtained.

Tecnotion provides standard and special components which are suitable for numerous linear motor applications. These components can easily be applied in your system.

2.1 Basic components

The basic Linear Motor components supplied by Tecnotion are:

- The coil unit (the N and S version differing in voltage and current requirements)
- The magnet yoke (in different lengths, varying in outer dimensions)

![Picture 2.1: A complete ironless linear motor system](image1)

![Picture 2.2: A coil unit and magnet yoke](image2)
2.2 Additional features

For a proper installation of your linear motor system you also need:

- fixing components, like bolts and dowel pins;
- additional devices, like a servo controller and a linear encoder;
- the right tools.

These features are no part of Tecnotion’s standard delivery.

2.2.1 Bolts and dowel pins

The following bolts and dowel pins are required for positioning and fixing the coil unit to the slide as well as connecting the magnet yokes to the mounting frame:

<table>

Table 2.4: Bolts for coil unit and yoke UC and UF series

2.2.2 Controller and measurement unit

Required is:

- An appropriate servo controller/amplifier
- A ruler and a linear encoder or an Hall module
- Power supply, cabling and connectors

For more information please contact Tecnotion.

2.2.3 Tools

Necessary for the installation is:

- Allen Key set

Occasionally useful are:

- Heat sink compound (optional)
- Isopropanol wipes to clean mounting surfaces
3. [ INSTALLATION ]

3.1 Cleaning

The magnet yokes show large attraction forces on all soft magnetic objects such as iron. These forces cannot be controlled by hand. They may cause serious jamming danger.

- Do not bring any soft magnetic objects (iron) nearer than 1m of the magnetic side of the magnet yoke.

- Magnetic sensitive objects like banking cards, pacemakers or other magnetic information carriers may be damaged if they are brought within 25cm of the magnet yokes.

- The magnet yoke and coil unit can be damaged when cleaned with a non-prescribed cleaning agent.

- Use only Isopropanol as a cleaning agent.

For general, non-cleanroom applications, the magnet yokes and coil units do not need to be cleaned intensively.

For cleaning purposes Tecnotions prescribes Isopropanol as cleaning agent for the magnet yoke and coil.

3.2 Cleanroom cleaning

For cleanroom applications Tecnotion products need to be cleaned additionally to remove dust particles.

3.2.1 Tools

- Isopropanol cleaning wipes
- Filtered pressed air installation
- Blacklight installation
- UV Glasses
- Cleanroom compatible vacuum cleaner
- Cotton swap
3.2.2 Cleaning instructions

Only the cleaning of the yokes is described. The same method can be used to clean the coils and the cables.

Initial cleaning

1. Clean the workstation with Isopropanol cleaning wipes (IPA). Make sure the workstation is clean.
2. Blow filtered pressed air in to the gap between each pair of magnets.
3. Blow filtered pressed air in to the side of the yoke. Repeat for the other side.
4. Clean the yoke with a cleanroom compatible vacuum cleaner.
5. Repeat the process for the other side of the yoke.
6. Clean all sides of the magnet yoke with IPA cleaning wipes. Only move the IPA cleaning wipe in one direction, do not move back and forward. This will enhance the cleaning action.
7. Clean the inside of the magnet yoke with an IPA cleaning wipe and a cotton swab.

Verification of cleaning

8. Inspect the magnet yoke with the blacklight installation for remaining dust particles. Especially check the areas between the magnets and the gap between the magnets and the bottom of the yoke.
9. If dust particles are visible: Remove them with an IPA cleaning wipe and cotton swab until the surface is cleaned to an acceptable level.

Verification of surface pollution

10. Inspect the yoke with the blacklight installation for dust particles.

Intensive cleaning

5. Clean the workstation with IPA cleaning wipes.
6. Place the magnet yoke on the cleaned workstation.
7. Blow filtered pressed air in to the side of the yoke. Repeat for the other side.
8. Clean the yoke with a cleanroom compatible vacuum cleaner.
9. Repeat the process for the other side of the yoke.
10. Clean the inside of the magnet yoke with an IPA cleaning wipe and a cotton swab.

UV Blacklight can cause irreversible damage to the eyes and other tissue when exposed. When using a UV Blacklight installation wear appropriate protective clothing and glasses.
3.3 Installation

Vacuum installation

For installation of vacuum motors special instructions are required, these instructions can be found in the vacuum appendix.

Before installing the Linear Motor components, the installation of the mounting frame should be completed. The slide should be provided with bearings, dampers, linear probe and required cabling in such a way that a smooth, save and well positioned transport of the slide over the stroke is established. The ruler should be properly positioned and fixed to the frame. The operation of bearings and dampers should be tested as well as the guidance of the moving cables.

The correct installation order is for electrical safety reasons:
1. Mount the magnet yokes to the mounting surface of the machine.
2. Mount the coil unit to the involved machine parts
3. Connect the wiring to the coil unit.

From a magnetic point of view the installation order of the mechanics is not critical, because no attraction is present between the coil unit and magnet yokes.

The de-installation order is:
1. Disconnect the wiring from the coil unit.
2. Dismount the coil unit from the machine parts.
3. Dismount the magnet yokes from the machine’s mounting surface

Before mounting the Linear Motor, special attention must be paid to the mounting surface of the motor.

---

Before starting the installation, check the presence of the right number and type of the delivered components. In case of doubt, please contact Tecnotion immediately.
### 3.4 Requirements for the mounting surface

The mounting surfaces of both magnet yokes and coil units have to be flat to prevent them from being submitted to bending forces (see picture 3.3 and table 3.5).

<table>

Table 3.5: Installation tolerances U-series

The track of the magnet yokes – from now on to be called the magnet track – and the coil unit have to be aligned with respect to each other. Note that this has to be accomplished by the machine’s construction.

Axial reference for the magnet track (MR, see picture 3.6) can be obtained by the use of:

- Dowel pins in the middle yoke of a short track
- Dowel pins along the complete side of a long track
- Milled reference along complete side of a long track (inner radius < 0.2mm), or
- Alignment by hand during mounting

Axial reference for the coil unit (CR, see picture 3.6) is obtained by:

- Two dowel pins beside the first and last bolt of the coil unit
- Milled reference along complete side (inner radius < 0.2mm), or
- Alignment by hand during mounting

Only use the aluminium side of the UC and UF series housing as mounting surface (see picture 3.4). The epoxy/power cable side is not suited for alignment.

![Picture 3.3: Flatness and parallelism of mounting surfaces](image1)

![Picture 3.4: UC-UF coil](image2)

![Picture 3.5: UC-UF coil](image3)

![Picture 3.6: Air gaps and axial references, schematically](image4)
Note that only when the right references and dimensions as listed in table 3.5 are applied the right dimensioned air gaps (A1 and A2, see picture 3.6) will be obtained. The dimensions of the coil units and magnet yokes can be found in **APPENDIX A**.

### 3.5 Magnet yoke mounting

Especially the magnet yokes must be handled with care. They are sensitive to mechanical shocks. Never drop a magnet yoke or release it in an uncontrolled way!

Be sure that the mounting surfaces are free of contamination. Particles > 0.1mm can cause inaccurate placement and consequently damage to your Linear Motor.

The magnet yokes contain a strong magnetic field. Loose iron objects that are brought within 5cm of the yokes, can be drawn into the yokes and cause damage.

Magnetic sensitive objects like banking cards or other magnetic information carriers may be damaged if they are brought within 1m of the magnet yokes.

The magnet yokes do attract each other while mounting. Take care that the closing plates of one yoke do not damage the magnets of the neighbour magnet yoke while mounting.

It is recommended to start the mounting of the magnet track with the middle – and preferably the longest – magnet yoke. This middle yoke can be aligned using the 3mm dowel pins or a milled reference.

Fix the magnet yoke on the mounting surface with bolts using the prescribed tightening torque.

The following yokes can be mounted with mechanical contact using the mutual attraction force of the magnet yokes.

Take care: apply the principle of controlled rotational mounting. A straight forward directing and placing of the yokes implies the risk of striking due to magnetic forces. Uncontrolled approach may cause damage to the magnets (see picture 3.7)

The next magnet yokes should not be aligned on dowel pins. Using a track of pins has two disadvantages:

1. In that situation rotational mounting is difficult.
2. Mounting can be impossible because of tolerances. The yokes are designed for a contact mounting without guaranteed gap between them.

Using a milled axial reference is advised for placement of the next tracks.
Placement of just one yoke on each side of the middle yoke can be done by simply aligning the yokes with respect to each other.

There is no danger of mounting the magnet yokes with an incorrect orientation, the standard yokes are “Murphy-safe”. A 180° rotated yoke does not have any effect on the motor function.

### 3.6 Coil unit mounting instructions

Be sure that the mounting surfaces are free of contamination. Particles > 0.1mm can cause inaccurate placement and consequently damage to your Linear Motor.

The mounting of the coil unit on appropriate and clean mounting surfaces is very straightforward because no attraction forces are present between coil unit and magnet yokes. Please review chapter 3.1 Cleaning on page 9.

The coil unit can be placed into the machine by hand carefully, pushed to the axial reference and fixed with bolts. Tightening torque of the bolts as prescribed in chapter 2.1 Basic components on page 7.

For applications which are susceptible to vibrations, the bolts have to be secured against loosening by means of rings or (Loctite) thread lock.

In case of high continuous forces, apply a heatsink compound to obtain optimal thermal contact between the coil unit and the mounting surface.

### 3.7 Electrical connections

Before starting any activity on the wiring, make sure that the mains are disconnected. Work carefully according the instructions belonging to the applied servo controller. Be sure your machine as a whole meets the requirements of all applicable electrical standards, such as the EN 60204 standard.

#### 3.7.1 General remarks

The linear motor’s electrical wiring is externally configured with two 1.0 meter cables: a power cable and a temperature cable. If desired you can shorten these cables and provide them with appropriate connectors.

The UXA/UXX3S is delivered with a FLEX cable of 3m. Suitable for cable chains.

Both power cable and temperature cable are shielded with a braided metal cable shield for electromagnetic immunity. The shield is galvanically connected inside the coil unit housing.

Besides this manual you should follow carefully the installation instructions of your servo amplifier supplier. Make sure that the linear motor system as a whole meets all the applicable electrical directives.

For wiring scheme of the UM, UL, UXA and UXX series see figure 3.8.

The wiring scheme of the UF type is shown in figure 3.9.

The wiring scheme of the UC type is shown in figure 3.10.

The UC coil is supplied with a five wire cable. The green and the yellow wire do not have a function.
3.7.2 Power lines

The three phases of the motor's power cable have to be connected to the servo amplifier in such a way that the positive three phase direction of the motor conforms the positive direction of the linear encoder. This polarization has to be tested, it cannot be seen at first sight.

Testing the polarization is very important, because a wrong polarization will result in an uncontrolled run out of the slide.

The power cable can be confectioned by the user to fit on the servo drive. The power cables are not suited for use in cable chains.
### 3.7.3 Protective earth

Be sure that the earth shield of the cable is well connected – also through the connecting devices – to the PE connector or the housing of the amplifier. Most linear motors are driven on the principle of pulse width modulation. This involves large electrical impulses and causes a significant risk of electromagnetical interference.

Internally the motor’s PE wire (green/yellow) is galvanic connected to the motor housing. This wire must be connected to the PE connector of the servo amplifier. Provide the motor system with PE lines to the amplifier that are as short as possible.

### 3.7.4 Temperature Sensor

The coil unit of the UM, UL, UXA and UXX Linear Motors come equipped with two temperature sensors, one PTC-1k-type and one NTC-sensor. The UF series has only a NTC-sensor. The UC series has no temperature sensors. For more details about both sensor see the next three paragraphs.

The temperature cable consists of four wires. For wire color and function, see table 3.12.

### 3.7.5 Temperature protection

The temperature sensors are normally used for overheating protection of the coil unit. The NTC-sensor can be used for monitoring temperature, the PTC can be used as cut off sensor when the maximal temperature is exceeded. For specifications and characteristics see the next two paragraphs.

In cases where long peak currents are demanded, the thermal response time of the coil unit is too long to ensure a proper overheating protection by the sensors. The temperature sensors can ensure a proper protection up to an Irm of 25% of the peak current of the motor. This corresponds to a temperature increase of 4.5°C/s.

These long peak current conditions can occur for example during an accidental run or by taking a new axis in control.

In this case I²t protection is essential to prevent the coil unit from overheating. In almost all controllers an I²t-protection can be set in the software.

For more information contact Tecnotion’s Application support team.

3.7.6 PTC specification

The PTC-1k type is a sensor which has a very sudden resistance rise near the critical temperature of the coils. It is almost a digital indicator: temperature below vs. over critical temperature. Therefore it is very useful for signalizing over temperature without requiring sensitive electronics. Disadvantage is that it is not possible to obtain a temperate signal.

At room temperature the PTC has an electrical resistance <100 Ω. When the temperature raises to the critical temperature the resistance will increase rather uniformly up to 1000 Ω. Above this temperature the resistance increases exponentially. Now, 1000 Ω is the switching resistance. The amplifier should immediately stop the power supply when this resistance is exceeded. In this way overheating and motor damage can be prevented. No need to say that the PTC cable must be connected properly to the amplifier.

3.7.9 Polarization test

Before testing, make sure that the electrical and mechanical protection of the linear motor system is well configured!

Make sure that there is an effective protective earth. Make sure that there is no voltage at the wire terminals before connecting.

There is one regular way of testing the polarization. Some servo amplifiers can operate in an in moment service mode. By means of regulating an external resolver manually, it can be determined whether the motor's direction of running conforms the resolver's sense of rotation. If so, the motor is well connected. If not, two phases of the power cable – phase 1 and 3 – must be changed.

Internally all ironless linear motors are equally wired and connected, so one test satisfies to find out the polarization of a motor ruler combination. If more axes are constructed in exactly the same way the polarization will be equal.

For more information, please contact Tecnotion.
3.8 Transportation
For transport, additional transport packaging is necessary.

3.9 Storage

The Storage area for linear motor components needs to be clearly delimited with a warning sign: “Caution! Powerful magnets”

To ensure the product quality Tecnotion advises the following storage conditions:

- Only store motors and magnetyokes in their original packaging.

<table>
<thead>
<tr>
<th>Stacking height</th>
<th>4 cartons</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage temperature</td>
<td>-25°C to +55°C and a maximum rate of change of 20°C/hour</td>
</tr>
<tr>
<td>Storage humidity</td>
<td>5 to 95%, relative humidity with no condensation</td>
</tr>
<tr>
<td>Storage duration</td>
<td>No limitation.</td>
</tr>
</tbody>
</table>
4. [OPERATION]

4.1 Pre-commissioning

When you are convinced that your application’s linear motor system is assembled in a proper way, both mechanically and electrically, you can proceed to the next step. You can put your motor system into operation. But before powering the system, please do have a final check:

1. Does the slide have a free run over the whole magnet track, without touching small mechanical parts like bolts or contamination?
2. Are the mechanical end stops, end switches and the dampers well dimensioned and properly configured?
3. Does your system have an emergency stop?
4. When used, is the temperature cable properly connected?
5. Does the motor ruler combination have the right polarization?
6. Has the power cable been connected properly?
7. Does the physical earth have been connected properly?

4.2 Configuring

After the amplifier is powered up some input and output signals need to be examined.

1. Check the end switches by pushing the slide manually to the switch position. Simultaneously check whether the signal is detected by the amplifier.
2. Check the presence of the PTC signal.

3. The following motor items should be configured as parameter settings of the servo amplifier:
   - Maximum continuous current.
   - Maximum peak current.
   - Amount of coils.
   - Maximum speed.
   - Presence/absence of an electromechanical motor brake.
   - Magnet interval (North-South distance) and/or pole pitch (North-North distance).
   - Switching resistance of PTC.

4. The following settings for the ruler system should be configured as parameters of the servo amplifier:
   - Type of interface of the ruler system.
   - Resolution or period of the linear encoder.

5. These are the I/O parameters to be configured:
   - Settings of the available digital inputs and outputs. For instance, pay attention to the type of end switches.
   - Settings of the available analog inputs and outputs.

6. Finally the controlling parameters must be configured.
   - Current control settings. These settings depend on both motor and amplifier.
   - Speed control settings.
   - Position control settings.
For configuring several types of servo amplifiers Tecnotion can offer parameter files. With these files motor specific settings can be configured. Nevertheless, application specific settings should be configured by yourself. Please contact Tecnotion for information.

4.3 Testing
Before handing over the control of the linear motor to the closed loop feedback controllers, it is wise to perform some tests. Most important issue for testing are the end switches.

4.3.1 End switches
Check proper functioning of the end switches.

4.4 Starting up
- Start the tuning with very low speeds.
- Increase maximum speed if everything operates properly.

Before testing, make sure that the electrical and mechanical protection of the linear motor system is well configured!

Only one ground wire needs to be connected for proper grounding.
The Tecnotion vacuum motors come with stainless steel coil housing and PTFE flying lead wires to reduce outgassing. The magnet yokes are specifically designed for vacuum chamber compatibility e.g. by the application of nickel coated magnets.

All warnings and requirements as described in the ironless manual also apply to vacuum motors. This appendix only highlights the difference from standard ironless motors.

**CE certification/Machine Directive for vacuum motors**

Tecnotion B.V. declares that the UMV and ULV linear motors mentioned in this Installation manual are destined to be incorporated in or combined with other machines and are only in compliance with the Machine Directive (98/37/EC) for bus voltages below 75Vdc.

For higher bus voltages specific measures need to be taken to provide safe operation according to the Low voltage directive (2014/35/EU).

The extra measures needed to also comply for higher voltages are split in three different groups: <75Vdc, <250Vdc, <300Vdc

**COMPLIANCE WITH MACHINE DIRECTIVE FOR <75VDC**

Since all wires only have a single isolation and no shielding extra protection might be necessary for the application and is definitely advisable.

Because the vacuum motors normally operate in a (metal) vacuum chamber the chamber itself can be used as extra protective measurement. A grounded metal vacuum chamber will keep all EMC distortion inside the chamber and makes it impossible to touch the coil. This protection is only sufficient when it is combined with a fail save that when the chamber is opened all power to the coil is disconnected automatically.

The vacuum chamber wall is advised to be connected to a physical earth to prevent possible shock.

The UMV and ULV Vacuum motors are not supplied with an internal strain relief. Appropriate strain relief of the power and sensor wires need to be provided externally.

UMV and ULV power and sensor cables only have single isolation. Without further protective measures they may only be used below 75Vdc.

UMV and ULV coils do not have a PE wire. Appropriate grounding of the stainless steel housing with respect to the used bus voltage and application needs to be implemented by the customer.
When all above safety warnings are respected the vacuum motors are in compliance with the Machine Directive (98/37/EC) for bus voltages below 75Vdc.

**COMPLIANCE WITH MACHINE DIRECTIVE FOR 75VDC TILL 250VDC**
All requirements as described in "Compliance with Machine Directive for <75Vdc" need to be implemented.
Since the cables only have single insulation for the use above 75Vdc extra isolation needs to be added.
Extra measurements with respect to grounding, shielding (EMC) and isolation need to be taken in to account depending on the application.

**COMPLIANCE WITH MACHINE DIRECTIVE FOR <300VDC**
All requirements as described in “Compliance with Machine Directive for <75Vdc" and “Compliance with Machine Directive for 75Vdc till 250Vdc” need to be implemented.
The temperature sensor cables are only rated till 250Vdc, they cannot be used above 250Vdc.
It is not allowed to use the vacuum motors above 300Vdc.
